ONLY PRIMARY DRAINAGE- SOLO DERIVAZIONE PRIMARIO SCARICO

MAINTENANCE INSTRUCTIONS - ISTRUZIONI DI MANUTENZIONE

- UK**
- Do not use abrasives and/or sharp/scraping objects to clean.
 - The siphon trap should be cleaned periodically to remove any dirt that may have collected.
 - We recommend the use of EasyClean Set (ED-SC) for daily maintenance and cleaning.
- IT**
- Pulire senza utilizzare sostanze abrasive e/o oggetti taglienti o abrasivi.
 - Eliminare periodicamente le eventuali contaminazioni dal sifone antiodore.
 - Consigliamo di utilizzare EasyClean Set (ED-SC) per la manutenzione giornaliera e la pulizia approfondita.

SIPHON CLEANING - PULIZIA DEL SIFONE

Important assembling advice: Dual Smart

Suitable for renovation work and new construction

Dual Smart should only be installed by specialist companies in compliance with the building regulations. To achieve the best possible result, please carefully read the installation guide. If you have any questions, please consult your supplier.

- Please check the content of the package for completeness and integrity before proceeding with the assembly. Do not install the drain if any deviations are noted. Should this be the case, please consult your supplier.
- Prior to the assembly, the assembling advice and its special characteristics should be discussed with the tiler. After the assembly, please provide the tiler with the complete assembling advice.
- If the drain is used for several showers, please check to make sure that the drainage capacity is sufficient. If you are unsure, please consult the supplier for advice.
- If you are not using the second drainage level (secondary water drainage), the joint between the shower drain and the tile frame should be sealed with a permanent sealer.
- We recommend taping or closing the drain opening of the shower drain with a cement cap prior to the assembly to prevent construction debris from getting into the drainage pipe. To prevent damage to the tile frame, it should be kept in the package until the final installation by the tiler.
- Make sure the drain is level all around.
- Install the sewage system in compliance with the standards. **Note:** ensure that the sewage system is well ventilated and that the gradient is sufficient.
- Check the drainage system and the sewer system connection for tightness.
- In order to prevent hollow spaces, the drain must be fully lined and sealed with floor pavement to the upper edge of the flange.
- The seal is applied in compliance with general standards for indoor sealing of wet areas. If alternative seals are used, please read the manufacturer's product information.
- When tiles are being fitted, the gradient of the tiles (min. 2% per linear metre) in the shower must always be towards the drain. The tiles should be laid level or 1 mm higher than the top edge of the tile frame to ensure good drainage toward the shower drain. **Note:** the requirements with regard to the floor gradient may be different for walk-in showers with glass walls. Please consult your supplier in this respect.
- Once the tiles have been fitted, the joint between the tiled floor and the drain should be permanently sealed with an elastic sealant (maintenance joint). The adhesion surfaces should be free of mortar, adhesive and other adhesion-reducing materials.
- The drain is only intended for use with waste water common in households. Do not use other fluids as well as cleaning agents with the potential to damage sanitary equipment, drainage equipment and raw materials.
- If the drain is used for other purposes (e.g. swimming pools), where it may come in contact with aggressive cleaning agents or corrosive substances such as salt or chlorine, please consult your supplier.
- Compliance with this installation advice is required for any warranty claims based on our sale and delivery terms.

Caution !

- Tile cleaning products often contain aggressive chemicals that are abrasive in nature and may damage the drain. Please ensure that the drain is thoroughly flushed after using any tile and grout cleaning products.

Importanti istruzioni di montaggio: Dual Smart

Adatto per le ristrutturazioni e le nuove costruzioni

Per l'installazione di Dual Smart si raccomanda di incaricare una ditta specializzata che tenga conto delle norme edilizie vigenti. Per un risultato ottimale leggere con cura la guida al montaggio. In caso di domande contattare il Vostro fornitore.

- Prima di iniziare il montaggio controllare che il contenuto della confezione sia completo e intatto. In caso di differenze non montare lo scarico. In tal caso contattare il Vostro fornitore.
 - Prima del montaggio discutere con il piastrellista le istruzioni di montaggio con le relative particolarità. Dopo il montaggio consegnare tutte le istruzioni di montaggio al piastrellista.
 - In caso di utilizzo dello scarico con più docce controllare se la capacità di scarico del sistema di drenaggio sia sufficiente. Consultare il Vostro fornitore al merito.
 - In caso di inutilizzo del secondo livello di scarico (derivazione secondo scarico) la fuga tra i canali di scarico doccia e il telaio per piastrelle deve essere chiusa con della pasta sigillante resistente.
 - Si consiglia di proteggere l'apertura di scarico del canale doccia prima del montaggio o di chiuderla con un tappo in cemento per evitare l'ingresso di impurità nel condotto di scarico. Per evitare guasti il telaio per piastrelle deve restare nella confezione fino al montaggio finale da parte del piastrellista.
 - Regolare lo scarico orizzontalmente in tutte le direzioni.
 - L'installazione del sistema di scarico deve essere eseguita secondo norma. **Avvertenza:** Far attenzione alla ventilazione e alle pendenze sufficienti nel sistema di scarico.
 - Controllare la tenuta ermetica del sistema e dei raccordi di scarico.
 - Per evitare vuoti l'unità di scarico deve essere completamente rivestita e compattata col pavimento fino allo spigolo superiore della flangia.
 - L'impermeabilizzato avviene secondo base al standard di costruzione. In caso di utilizzo di isolamenti alternativi osservare le informazioni sul prodotto del produttore.
 - Nella fase di posa delle piastrelle in ceramica la pendenza delle piastrelle (min. 2% per m¹) nella zona doccia deve correre sempre lungo lo scarico. Le piastrelle devono essere posate allo stesso livello o 1 mm più alte rispetto allo spigolo superiore del telaio per piastrelle. In tal modo è possibile garantire un buon drenaggio al canale doccia. **Avvertenza:** Per le docce
- a pavimento con pareti in vetro vanno osservati altri requisiti relativi alle pendenze. Contattare a tale scopo il Vostro fornitore.
- Dopo la posa delle piastrelle il passaggio tra il pavimento a piastrelle e lo scarico deve essere impermeabilizzato a lunga durata con una fuga elastica (giuntura di manutenzione). Le superfici adesive devono essere prive di malta, colla e materiali simili che riducono l'aderenza.
 - Si possono introdurre solo acque reflue domestiche. Non è consentito introdurre altro tipo di liquidi, come detersivi che possono danneggiare i sanitari, i componenti dello scarico e i materiali dei tubi.
 - In caso di impiego dello scarico in altri ambiti (ad es. vasca da bagno), nei quali lo scarico può venire a contatto con detersivi aggressivi o sostanze corrosive come sale o cloro, contattare il Vostro fornitore.
 - Il contenuto di questi consigli di montaggio è il presupposto per una garanzia in base alle nostre condizioni di vendita e consegna.

Attenzione!

- I detersivi per piastrelle contengono spesso prodotti chimici aggressivi. Questi possono aggredire la superficie del canale. Qualora si usino detersivi per piastrelle e fughe pulire bene lo scarico successivamente.
